

Execution Report

Title: The Fairness of Credit Scoring Models

Authors: Christophe Hurlin, Christophe Pérignon and Sébastien Saurin

Full reference: Hurlin, Christophe, Pérignon, Christophe, and Saurin, Sébastien, "The Fairness of Credit Scoring Models" Working paper, October 20, 2021.

The structure and contents of this execution report provided by **cascad** for the certification are similar to those recommended by the [AEA Data Editor](#).

1. DATA DESCRIPTION

This study uses the the German Credit Dataset (Dua and Gra (2019)), which includes 1,000 consumer loans extended to respectively 310 women and 690 men. This dataset can be downloaded here: [https://archive.ics.uci.edu/ml/datasets/statlog+\(german+credit+data\)](https://archive.ics.uci.edu/ml/datasets/statlog+(german+credit+data)) All the variables used in the model are described in Tables 5 and 6 in the article.

2. CODE DESCRIPTION

For the purpose of this certification, we aimed to check the results displayed in Figures 2-10 and in Tables 1-4.

There are eleven files in the replication package:

1. GermanDataset.data: Database used in the paper.
2. Fairness_func.py: Python file including functions used to implement fairness tests and Fairness Partial Dependence Plots (FPDP)
3. KPrototypes.py: Python file used to create classes of individuals having similar characteristics according to KPrototype method.
4. Data_management.py: Python file used to manage the database to estimate models and apply the framework.
5. Modelisation_no_gender.py: Python file used to estimate all models excluding the gender variable from the list of explanatory variables.

6. `Modelisation_gender.py`: Python file used to estimate all models including the gender variable in the list of explanatory variables.

7. `Workspace.py`: Python file used to save (restore) environment variables in (from) an external file of format "variables day-month-year.out". For example: "variables 01-01-2021.out" for the following date: January 1st of 2021.

8. `package_version.py`: Python file used to save in an Excel file "packages_version.xlsx" all the packages used in the code as well as their python version.

9. `Tables.py`: Python file used to produce a LaTeX file of format "All_figures-day-month-year.out" with all the figures (except Table 7) of the paper from the results obtained with the other files. This file is also converted in pdf and read directly from this python code.

10. `Execute.py`: Python file used to run all the previously mentioned files.

11. `packages_version.xlsx`: Excel file including all python packages version used to reproduce the results of the paper.

3. REPLICATION STEPS

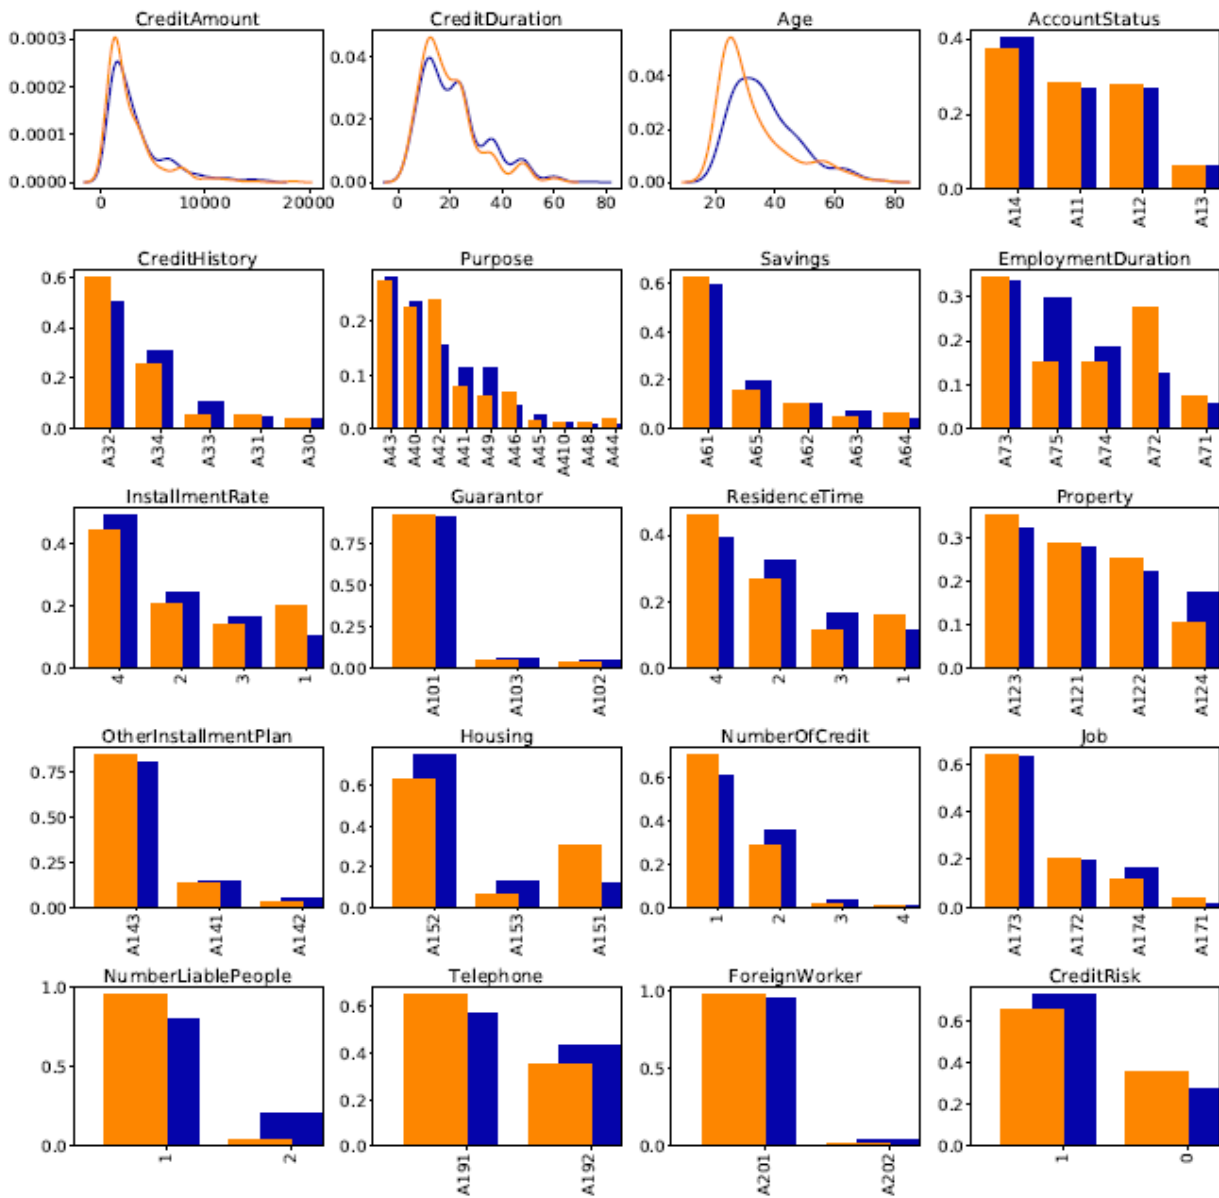

The replication material, using Python 3.8 with the latest Anaconda distribution (2021.05) on a computer with 64GB RAM, intel® Core™ i9-9900K CPU @3.60-5.00GHz, Nvidia Geforce RTX 2060, and Windows 10 OS. We encountered no issues during the replication.

4. FINDINGS

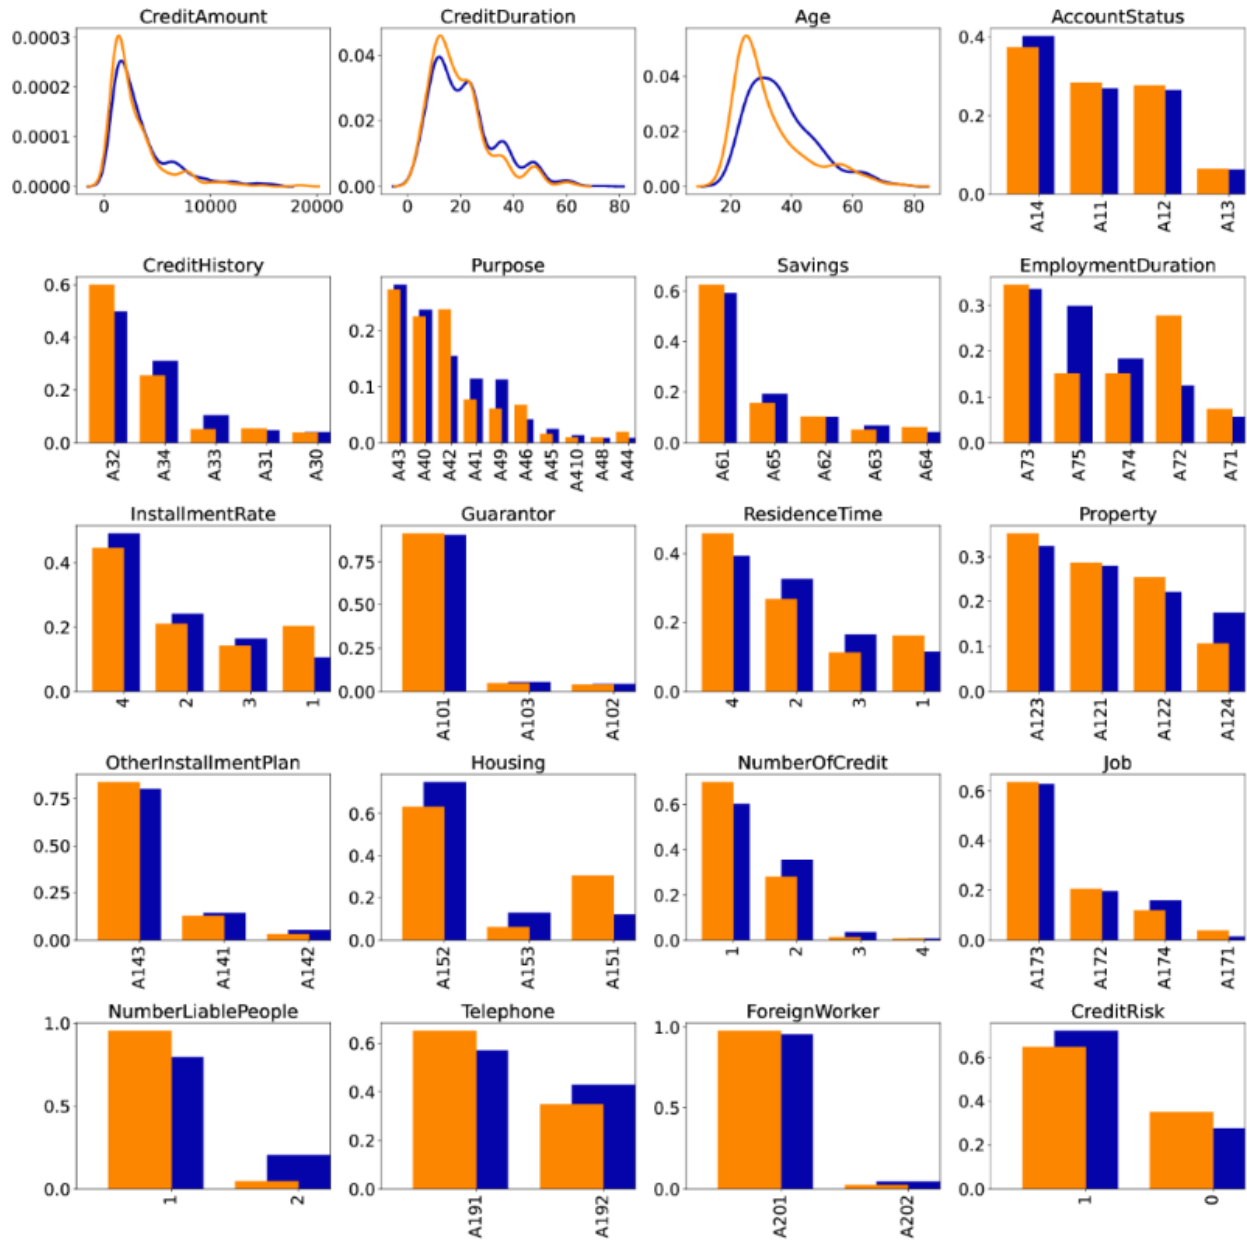

We reproduced all tables and figures with perfect accuracy.
